I. Graphing " $y=\mathrm{ax}^{2}+\mathrm{b} \boldsymbol{x}+\mathrm{c}$ " (pp.625-630): is a "parabola" which opens
 upward if $\mathrm{a}>0$ and downward if $\mathrm{a}<0$

Vertex is "turning" point where the parabola is
intersected by (vertical) line of symmetry, $\boldsymbol{x}=\frac{-\mathrm{b}}{2 \mathrm{a}}$

## II. Examples (p.632): Problems\#2,10,12

III. $\boldsymbol{x}$-intercepts (p.629): point(s) where the graph "intersects" the $\boldsymbol{x}$-axis, requires $\boldsymbol{y}=0 \ldots$

IV. Examples (pp.632-633): Problems \#14,18,22,24

HW: pp.632-633 / Problems\#1,11,13,19,21,23,25, 31-47(odd)
