## V. Parabola Graph Features:

$y=a x^{2}+b x+c$ is a parabola which... opens upward ( $\mathrm{a}>0$ ) or downward ( $\mathrm{a}<0$ )
Vertex @ $\boldsymbol{x}=-\mathrm{b} \div(2 \mathrm{a})$
$(0, \mathrm{c})$ is the $\boldsymbol{y}$-intercept, and
has $\boldsymbol{x}$-intercept(s) @ $(\boldsymbol{x}, 0)$ where $\boldsymbol{x}=\frac{-\mathrm{b} \pm \sqrt{\mathrm{b}^{2}-4 \mathrm{ac}}}{2 \mathrm{a}}$

$$
\mathrm{b}^{2}-4 \mathrm{ac}\left\{\begin{array}{l}
>0 \geq 2 \boldsymbol{x} \text {-intercepts } \\
=0=1 \boldsymbol{x} \text {-intercept } \\
<0 \geq \text { no } \boldsymbol{x} \text {-intercepts }
\end{array}\right.
$$

VI. Standard Form (not in text):

$$
\boldsymbol{y}=\mathrm{a}(\boldsymbol{x}-\mathrm{h})^{2}+\mathrm{k} \quad \text { has Vertex } @(\mathrm{~h}, \mathrm{k})
$$

VII. Examples (p.632): Problems \#8,16,26?

HW: p. 632 / Problems \#3,7,9,15,17
